C -- FUNCTION: CRUCIAL IN THE ASSEMBLY, EXPRESSION, AND FUNCTIONAL

MODULATION OF THE HETEROTHERENC COMPLEX OF THE SODIUM CHANNEL.

C THE BETA-1 SUBINIT CAN MODULATE MULTIPLE ALPHA SUBUNIT

ISOFORMS FROM BRAIN, SKELFTL MUNSCLE, AND HEART.

C SUBUNIT: THE SODIUM CHANNEL CONSISTS OF A PORE-FORMING ALPHA

SUBUNIT, BETA-1 AND BETA-2 SUBUNITS. BETA-1 IS NONCOVALENTLY

ASSOCIATED WITH ALPHA, WHILE BETA-2 IS COVALENTLY LINKED BY
                                                                                                                                                                                                                                                                                                         -!- DISEASE: DEFECTS IN SCN1B ARE A CAUSE OF GENERALIZED EPILEPSY WITH FEBRILE SEIZURES PLUS (GEFS+), A DISEASE CHARACTERIZED BY. A HIGHLY VARIABLE PHENOTYPE COMBINING FEBRILE SEIZURES, GENERALIZED SEIZURES OFTEN PRECIPITATED BY FEVER AT AGE 6 YEARS OR MORE, AND PARTIAL SEIZURES, WITH A VARIABLE DEGREE OF SEVERITY.
-!- SIMILARITY: BELONGS TO THE IMMUNOCLOBULIN SUPERFAMILY.
-!- SIMILARITY: CONTAINS I IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
                                                                                                                                                                                                                                                                 -!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: ABUNDANTLY EXPRESSED IN SKELETAL MUSCLE, HEART

Bacteriol. 171:1075-1086(1989).

-!- FUNCTION: THE KEY ENZYMATIC REACTIONS IN NITROGEN FIXATION ARE CATALYZED BY THE NITROGENAEZ COMPLEX, WHICH HAS 2 COMPONENTS: THE IRON PROTEIN (COMPONENT 2) AND A COMPONENT 1 WHICH IS EITHER A MOLYBDENUM-IRON PROTEIN, A VANADIUM-IRON, OR AN IRON-IRON PROTEIN.

-!- CATALYTIC ACTIVITY: 8 reduced ferredoxin + 8 H(+) + N(2) + 16 ATP - 10 COFACTOR: BINDS ONE 4FE-4S CLUSTER PER DIMER.

-!- COFACTOR: BINDS ONE 4FE-4S CLUSTER PER DIMER.

-!- SUBUNIT: HOWODIMER.

-!- SUBUNIT: HOWODIMER.

-!- STREAM OF A STREAM OF A STREAM OF A STROGENASE.

-!- SIMILARITY: BELONGS TO THE NIFH / BCHL / CHLL FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

This invention describes a novel antibody specifically recognizing phosphatichidylinostice. 4.5-triphosphate (PPR3). The antibody of the invention is used in immunogenic compositions in which a dead salmonella genus microbe is used as an adjuvant and mixed with PIP3. The antibody can be used in an immunosasay contraining a step in which the above antibody or its variable region is reacted with PIP3 present in a sample and the bond based on their immunological reaction. The method can determine PIP3 eaally in a high sensitivity. This sequence represents the murine PIP3 recognizing monoclonal antibody variable region light chain complementarity determining region, CDR3 described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hybridoma antibodies have been produced with the spleen cells of BALB/c mouse that had received multiple injections of mercuric ions reacted with glutathione to produce a mercuric ion coordinate covalent compound which was covalently bound to keyhole limpet covalent compound which was covalently bound to keyhole limpet covalent compound which was cavalently bound to keyhole limpet covalent compound which was [1F10, 4A10, 1C11, 5G4, 23F8, 2D5, 5B6 and 3E8) were producing MADS that were strongly positive against glutatione-mercuric ions but negative against glutathione without mercuric ions. RNA was isolated from hybridoma cells with guanidine isothiocyanate. First strand cDNA synthesis was catalysed by Multy reverse transcriptese. The primers used for cDNA synthesis contine expressed by the hybridoma of interest, or to the Fs and of the C kappa domain. Some of the primers used for cDNA synthesis are shown in AAQ97511-Q97518. The primer used for cDNA synthesis of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide(s) which bind heavy metals, esp. mercury - derived from monoclonal antibodies, used for detecting, removing, adding or neutralising heavy metals
                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel antibody specifically recognizing. phosphatidylinositol.3,4,5-triphosphate (PIP3). The antibody of the invention is used in immunogenic compositions in which a dead salmonella genus microbe is used as an adjuvant and mixed with PIP3. The antibody can be used in an immunoassay containing a step in which the sample antibody or its variable region is reacted with PIP3 present in a sample and the bond based on their immunological reaction. The method can determine PIP3 easily in a high sensitivity. This sequence represent
        for PCR amplification of that variable region, in conjunction with an appropriate V-region primer. In addition, the VH primer AAQ97518 was used to amplify the MAD 2DS and 5B6 heavy chains. The sequences of the PCR amplified nucleotides were determined. These are given in AAQ97498-Q97510 and the deduced AA sequences in AAR79241-R79250 ft AAR78970-R78971. The descriptions of the SEQ ID nos given on pp 44-45 and in the claims are different from the descriptions in the sequence listings are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the murine PIP3 recognizing monoclonal antibody variable region light chain described in the method of the invention.
                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorder.

Calf thymus DNA was used to immunise a MRL-1pr mouse, spleen cells from which were then fused with Sp2/0 myeloma cells to give hybridomas producing the anti-DNA MAD. 15d8 was found to react strongly with single stranded DNA and poly(dT), and weakly with poly(dG).

The present sequence is the light chain variable region of the anti-DNA monoclonal antibody (MAb) 9f11, which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically pinds a DNA hairpin. The MAD can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anti-DNA antibody which specifically binds DNA hairpin - useful to

      disorder.

Calf thymus DNA was used to immunise a MRL-1pr mouse, spleen cells from which were then fused with Sp2/0 myeloma cells to give hybridomas producing the anti-DNA MAb. 9f11 was found to react strongly with single stranded DNA and poly(dT), and weakly with

The present sequence is the light chain variable region of the anti-DNA monoclonal antibody (MAb) 15bl0, which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically binds a DNA hairpin. The MAb can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen
                                                                                                                                                                                                                     disorder.

Calf thymus DNA was used to immunise a MRL-lpr mouse, spleen cells from which were then fused with Sp2/0 myeloma cells to give hybridomas producing the anti-DNA MAD. 15b10 was found to react strongly with single stranded DNA and poly(dT), and weakly with

                                                                                                                                                                                                     The present sequence is the light chain variable region of the group 9f11 putative consensus anti-DNA monoclonal antibody (MAb), which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically binds a DNA hairpin. The MAb can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be
                                                                                                                                                                                                                                                                                                                                used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above disorder.

He sequence was derived by aligning homologous anti-DNA MAb, whose sequences have been published, as well as several MAb of other specificities obtained from a database search.
                                                                                                                    develop prods. for diagnosis and treatment of disorders, e.g. glomerulonephritis or systemic lupus erythematosus

                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                              The present sequence is the light chain variable region of the anti-DNA monoclonal antibody (MAb) 5f3, which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically binds a DNA hairpin. The MAb can be used diagnose
                                                                                                                                                                                                                                                          disorder.

Calf thymas DNA was used to immunise a MRL-lpr mouse, spleen cells from which were then fused with Sp2/0 myeloma cells to give hybridomas producing the anti-DNA MAb.

```
pullato and represents the heavy chain and light chain variable regions pullato and represents the heavy chain and light chain variable regions (WH and VL) of the monoclonal antibody (WAb) PR1. The CDNA encoding this sequence was derived by PCR amplification of reverse transcribed PR1-hybridoma RNA using the primer sequences given in AAG64477-81. The VH and VL complementarity determining regions (CDRs) are used in the construction of the MAb of the invention which competes with RN1 for binding to a prostate call associated antigen. The MAb of the invention can be used for targetting a drug, cytotoxin or radioisotope to prostate cells of a patient suffering from prostate cancer. It can individual and for the diagnosis and treatment of other conditions involving abnormal growth of prostate cells, eg. benign prostate in an individual and for the diagnosis and treatment of other conditions involving abnormal growth of prostate cells, eg. benign prostate cells but only weakly with a few other normal human tissues. The effect of therapy on normal prostate cells does not threaten the overall health
                                                                                                                                                                                                                                                          sequence is encoded by the PE38KDEL fragment of the plasmid
                                                                                                Monoclonal antibody specific for prostate cells - used in the diagnosis and treatment of conditions involving abnormal growth of prostate cells, esp prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, composition for interior, errors, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protezoa or helminths. The autoimmune diseases include multiple sclerosis, Grave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myssthenia gravis, insulin-dependent Multifunctional polypeptides comprising binding sites that specifically recognise extracellular groups of the NKG2D receptor complex and domains which function as receptors or ligands, useful for treating diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatitis. Sequences AAU72820-AAU72875 represent the NKG2D receptor and the polypeptides of the invention. Example 7; Fig 16; 114pp; English cancers and infectious diseases WPI; 2002-055119/07. This is the amino acid sequence of 8019 VK antibody. The invention relates to the site-specific photo-attachment of a nucleic photo-affinity compound to an antibody which comprises reacting them under conditions that promote attachment of the photoaffinity compound to at least 1 nucleotide binding site in the antibody. Also claimed are: photoaffinity compound-antibody conjugates produced this way, and immuno-conjugates comprising cytotoxic or therapeutic agent site-specifically attached to the photoaffinity compound in the conjugate. When the conjugate is labelled it is used for detection or quantitation of an antigen (Ag) by any standard immunoassay format, while immuno-conjugates are used therapeutically, e.g. in cases of tumours, infections or genetic diseases, or as imaging agents. The conditions, particularly a single 2-5 minute photoactivation results in almost 100% attachment (contrast conditions usually required to attach

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is a murine anti-Tie2 kinase receptor agonist monoclonal antibody 15B8 light chain variable region. Tie2 is a single-transmembrane, tyrosine kinase receptor ('Tie' stands for tyrosine kinase receptor with immunoglobulin and endothelial growth factor (EGF) homology domain(s)). Anti-Tie2 antibodies may be administered to enhance anglogenesis in mammals suffering from ischemic disease, myocardial infarction or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tie2 receptor agonist antibodies useful for promoting angiogenesis in patients suffering from strokes and myocardial infarctions
('Tie' stands for tyrosine kinase receptor with immunoglobulin and endothelial growth factor (EGF) homology domain(s)). Anti-Tie2 antibodies may be administered to enhance angiogenesis in mammals suffering from ischemic disease, myocardial infarction or cerebral st or other vascular diseases such as diabetes. It may also be used to enhance endothelial cell survival and to promote haematopoietic or megakaryocyte cell proliferation (claimed).
                                                                                                                                                                                                              Gaps

The present sequence represents the light chain of an antibody reactive against p53. The antibody is obtained from a vertebrate host expressing con immune response against a naturally occurring disease. The antibodiles are useful in pharmaceutical compositions, which additionally contain correlators, drugs, prodrugs, toxins and imaging markers e.g. radioisocropes correlators, drugs, prodrugs, toxins and imaging markers e.g. radioisocropes correlatoring in inducing an immune response against a disease in a vactobrate, for treatment and/or prophylaxis of disease and for detection currebrate, for treatment and/or prophylaxis of disease and for detection correlatorial as for gene therapy and recombinant production of the polypeptides. In particular, the following can be treated cancer, rheumatoid arthritis of and coronary heart disease. Cancers include carcinogenic tumours, tumours, competitudes and neck tumours, hepatic cancer, paracreatic cancer, ovarian cancer, head and neck tumours, hepatic cancer, paracreatic cancer, ovarian cancer, curinary/genital tract cancer, oseophageal cancer, mesenchymal tumours, e.g. B cell lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

murine anti-human glycoprotein (gp) 39 monoclonal antibody (MAb) 39-1.106 (a member of the murine kappa V subfamily). The MAb was c prepd. by immunising a 6-8 week old BALBAC mouse with a gp39-CD8 fusion protein, and 3 days later harvesting and fusing spleen and lymph cells to mouse melanoma cells, to produce an anti-human gp39 c MAb producing hybridoma. The MAb may be useful for diagnosing disease states, inhibiting B-cell activation and for treating immunological disorders, e.g. autoimmune disorders, allergic responses, organ rejection and graft versus host disease. It may also be used for imaging cells which express gp39 on their surface, e.g. tumour cells, and to target therapeutic agents to such cells. The MAb inhibits the CD40/gp39 interaction, therefore limiting both prim, and sec. responses to T-cell dependent antigens and Ab prodn. specific to these antigens. A typical compsn. for intramuscular injection pref. contains 50 mg of MAb in 1 ml of sterile buffered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Monoclonal antibodies specific for different epitope(s) on human gp39 - used for inhibiting B cell activation and for the diagnosis of various disorders, e.g. cancer, psoriasis etc..

                                                                                                                           Mouse monoclonal antibody B72.3; humanised antibody molecule;
TAG-72 antigen; antigen binding site; complementarity determining region;
VL domain; light chain cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A chimeric mouse-human light chain gene was constructed from B72.3 light chain clone (see AAN90672) and an M13-derived vector contg. the human c-kappa gene. Heavy and light chimeric genes as well as mouse heavy and light chain cDNA clones were were the separately into plasmid pEE6. The 4 expression constructs inserted separately into plasmid pEE6. The 4 expression constructs were used singly or in heavy/light chain gene pairs to transfect COS-1 cells. Transfection of COS cells with both the chimeric heavy and light chain genes generated a complete chimeric Ab molecule with TAG-72 antigen binding specificity. Humanising the B72.3 does not adversely affect its binding activity and this produces a humanised antibody molecule (HAM) which is useful in both therapy and diagnosis of certain carcinomas, eg solid tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant humanised antibody specific for TAG-72 - having complementary determining regions of variable domains from mouse antibody and the remainder from human immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

Monoclonal antibodies specific for different epitope(s) on human gp39 - used for inhibiting B cell activation and for the diagnosis of various disorders, e.g. cancer, psoriasis etc..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the light chain variable region of the humanised murine anti-human glycoprotein (gp) 39 monoclonal antibody (MAD) 39-1.106. The MAD may be useful for diagnosing disease states, inhibiting B-call activation and for treating immunological disorders, e.g. autoimmune disorders, allergic responses, organ rejection and graft versus host disease. It may also be used for imaging cells which express gp39 on their surface, e.g. tumour cells, and to target therapeutic agents to such cells. The MAD inhibits the CD40/gp39 interaction, therefore limiting both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prim. and sec. responses to T-cell dependent antigens and Ab prodn. specific to these antigens. A typical compsn. for intramuscular injection pref. contains 50 mg of MAb in 1 ml of sterile buffered

The bivalent antigen-binding protein B72.3 Fv (AAR20184) is an example of the antigen-binding proteins of the invention. They comprise a first Fv fragment bound to at least one other Fv fragment by a linker which keeps the Fv fragment apart. The connecting structure of AAR20184 comprises a joining sequence derived from a human 1gG1 domain linked to a complete human 1gG4 hinge region. AAR20185 is the sequence of the shortened hinge version of the B72.3 single chain Fv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New multivalent antigen-binding proteins - comprise Fv fragment linked to at least 1 other Fv fragment spacer and useful for in-vivo diagnosis or therapy

purification of the recombinant antibody"
                     This is the light (kappa)-chain variable (V) region of a mouse monoclonal antibody (MAb), 2G12, and is specific for an HIV-1 viral antigen. It is used in the construction of a chimeric MAb comprising heavy and light chains having murine V regions and human C regions. The chimeric MAbs are more effective than murine MAb 2G12 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MAbs can be treatment. They can also be used in diagnosis of HIV.

inserted into pcANTAB SE expression vector (clone II). The vector is used to transform probiotic bacteria like, Lactobacilli for expression and secretion of recombinant anti-rotavirus antibodies. The antibodies have antibacterial and antiviral activity. Antibody-expressing probiotic bacteria can be administered for treatment of gastrointestinal (II) tract infections and to immunise neonates, humans or immunosuppressed/immunodeficient adults acutely exposed to a bolus of GI pathogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of an antibody and/or chemokine construct that binds to a chemokine

```

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate immunodeficiency virus (e.g. human immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine

Use of an antibody and/or chemokine construct that binds to a chemokine receptor, for eliminating cells latently infected with primate immunodeficiency virus, or treating, preventing and alleviating immune disorders

Example 2; Page 49; 117pp; English.

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and rheumatoio, ancopic dermatitis and psoriatishs), inflammatory diseases inflammatory joint diseases (chronic arthritis), inflammatory diseases such as inflammatory joint diseases (chronic arthritis), inflammatory inflammatory bowel diseases and transplant rejections. The present sequence is murine MC-1 antibody

Use of an antibody and/or chemokine construct that binds to a chemokine receptor, for eliminating cells latently infected with primate immunodeficiency virus, or treating, preventing and alleviating immune disorders

Claim 29; Page 52; 117pp; English.

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate composition for eliminating cells latently infected with a primate composition for eliminating ells human immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and rheumatoid arthritis), allergic diseases, skin diseases (e.g. skin inflammatory diseases (chronic arthritis), inflammatory diseases such as inflammatory bowel diseases and graft versus host and transplant rejections. The present sequence is CCRSCXCD3 bispecific and transplant rejections. The present sequence is CCRSCXCD3 bispecific single chain matibody construct. This antibody construct comprises light chain variable domain (VL) and heavy chain variable (VH) domains of murine MC-1 antibody specific for human chemokine receptor 5 (CCRS)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A humanised anti-HMI.24 antibody has been developed which comprises human L and H chain C regions, and L and/or H chain V regions containing material originating in mouse anti-HMI.24 antibody. The V regions contain framework (FR) regions of human origin and complimentarity determining regions (CDR) of mouse origin, leading to a reshaped humanised antibody. The C regions are human Ck (L-chain) and human G agmam (specially C gamma 1) (H-chain). The FR regions of the L chain V region are derived from human subtype HSG1 (e.g. from human antibody RE1) and the FR regions of the H chain V region are derived from human antibody HG3 and FR4 from human antibody HG3 in The present sequence represents mouse L chain V region CDR 3 from the present invention. The antibodies are used for the treatment of myeloma, especially by injection, intravenously,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               intramuscularly or subcutaneously. The antibodies are used at 0.01-1000 (especially 5-100) mg/kg body weight. The humanised antibody has low antigenicity and is therefore effective therapeutically in humans.
and VH and VL domains of an antibody specific for a CD3 antigen joined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

ö
New antibodies have been developed which are specific for human parathormone related peptides (hPTRP). The antibodies comprise chimeric Land/or H chains, where the C region is of human and L region of mouse, origin. The present sequence represents a specifically claimed region of an antibody of the invention. Host cells, transformed with vectors containing DNA encoding antibodies of the invention, can be used to produce the antibodies. The antibodies may be used to treat hypercalcaemia, especially that due to a malignancy, e.g. cancers of pancreas, lung, throat, larynx, tongue, gum, oesophagus, stomach, liver, breast, kidney, bladder, womb or prostate or malignant lymphoma. They may also be used for treatment of hypophosphaemia such as that due to pathogens or to vitamin D resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

Hypercalcemic crisis; parathyroid hormone related peptide; PTHrP; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of treatment of hypercalcemic crisis. A composition for the treatment of hypercalcemic crisis contains as active component a substance which inhibits the binding of parathyroid hormone related peptide (PTHrP) to its receptor. The inhibitor is used
                                                                                                                                                                                                                                   The present invention describes compositions for the treatment of cachexia containing a substance which inhibits the binding of a parathyroid hormone related peptide (PTHTP) to its receptor, as an active component. This substance may be an antagonist to the receptor, recognising PTHTP. The antibody is preferably humanised or chimeric. The present invention also describes a humanised antibody prepared by hybridoma 23-57-137-1 (FREM BP-5631). The composition is used for the treatment of cachexia arising in connection with diseases such as cancer, thereby improving the quality of life of the patient. The present sequence represents mouse humanised antibody light chain CDS3 from #23-57-137-1 from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treatment of hypercalcemic crisis with a substance inhibiting binding of parathyroid hormone related peptide to its receptor
                                                                                                                   Inhibitors of binding of parathyroid hormone related peptide to its receptor - useful for, e.g. treatment of cachexia arising from cancer or other diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 40, DB 20; Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                            Reconstituted human antibody; peptide antigen HM1.24; framework region; complementary determining region; CDR; anti-HM1.24 antibody; myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes a reconstituted human antibody recognizing the peptide antigen HM1.24. This human antibody contains natural human framework regions modified by amino acid substitutions to provide homogeneity with a previously designed framework region (which may arise from a human or non-human source); and complementary determining regions (CDR) derived from a non-human anti-HM1.24 antibody. The reconstituted antibody is useful in the treatment of diseases in which the surface antigen HM1.24 is implicated such as myeloma. The present sequence is used in the creation of the antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The method is used to inhibit tissue decomposition caused by cancer cachexia, septicemia, heavy external injury or muscular dystrophy, and for treating patients with elevated cytokine (Interleukin-6, Granulocyte colony stimulating factor, Interleukin-11 and Leukemia inhibitory factor) levels. It may also be used for preventing weight loss caused by cancer cachexia. The present sequence represents a peptide, which is used in the course of the invention.
the treatment of hypercalcemic crisis, such as that associated with

                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                      recognises parathyzoid hormone-related peptide (PTHTP) - see AAG64793.

The composition consists of a solution of the antibody in a buffer of pH and their salts. The composition has increased storage stability, especially at elevated temperatures. The composition antagonises the action of PTHTP, and may be used in the treatment of diseases involving disturbances of calcium regulation (high or low serum calcium concentration) such as humoral hypercalcaemia of malignancy and as an analgesic. The present sequence represents one of the light chain complementarity determining regions (CDR) of an anti-PTHTP antibody.
                                                                                                   Composition for treating diseases of calcium regulation and for use as an analgesic, comprises an antibody recognizing parathyroid hormone
                                                                                                                                                                                           invention relates to a stabilised composition of an antibody which
                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

(1) contains as an active component a substance which promotes or hibhbits the binding of ligands to PTH receptor or PTHFP receptor, or is an agonist to antagonist to these receptors. (1) have analgesic, immunosuppressive, nootropic, neuroprotective, antiinflammatchy,
vasopressin levels, and symptoms caused by this depression, containing as an active component a substance which inhibits the binding of parathyroid hormone related peptide (FTHFP) to its receptor. (I) has antidiarheic, antiemetic, antidiabetic and antipyretic activities. (I) can be used for the amelioration of symptoms caused by decrease in vasopressin levels, such as that due to cancer are treated using the agent. These symptoms include dehydration, excessive urination, thirst, vomiting, diarrhoea, fever, perspiration and diabetes. AAF69085 to AAF69140 and AAB7687 to AAB76897 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Agents modifying the binding of ligands to parathyroid hormone recepto: or parathyroid hormone related peptide receptor for treatment of disorders associated with parathyroid hormone other than hypercalcemia
                                                                                                                                                                                                                                                                                                            Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an agent (I) for the treatment of drug-resistant hyperglycaemia. (I) contains as an active component a substance which inhibits the binding of parathyroid hormone related peptide (FTHIP) to its receptor. (I) is a calcium-antagonist. (I) can be used for treatment of drug-resistant hyperglycaemia e.g. associated with cancer. The hyperglycaemia is resistant to treatment with other drugs including bone resorption inhibitors (such as bisphosphonate or calcitonin), calcium elimination promoters and intestinal calcium absorption inhibitors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to agents for ameliorating symptoms causing joint diseases, containing a substance inhibiting the binding of a parathyroid hormone-related peptide to its receptor as active ingredient. The agents have osteopathic activity are useful for ameliorating symptoms caused by joint diseases relating to PTH or PTHrP e.g. chronic rheumatoid arthritis addrormans. The agents particularly improve the lowering of bone amount or suppression of bone reduction. The present sequence is that of a joint disease related protein peptide; useful to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Agents for ameliorating symptoms caused by joint diseases relating to PTH or PTHrP e.g. chronic rheumatoid arthritis, containing inhibitors on receptor binding of parathyroid hormone-related peptide -

                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the light chain variable region of the anti-human Fas ligand monoclonal antibody (MAD) NOK-5. NOK-5 is produced by the hybridoma NOK-5 (FERM BP-5048), which was prepared by immunising mice with transformed human Fas ligand expressing COS cells, and fusing spleen cells isolated from the mice with myeloma P3x6A948.653 (ATCC CRL-1580) cells. The MAD recognises the human Fas ligand on the cell surface or in solution, and can be used to inhibit the apoptosis inducing cell surface Fas ligand/Fas reaction. The MAD can also be used for a Fas ligand assay in phiological samples (e.g. human blood), especially for disease diagnosis, e.g. hepatitis, infectious mononucleosis and systemic

The present sequence is the light chain variable region of the murine anti-human Fas ligand (FasL) monoclonal antibody (MAD) NOK5, which is expressed by the hybridoma NOK5 (FERM BP-5044). The MAD can be used in the preparation of a composition for the effective carls caused by hepatitis, including hepatitis in liver calls caused by the binding of FasL to Fas expressing liver in liver calls caused by the binding of FasL to Fas expressing liver calls, and improves liver function by improving blood glutamate calls, and improves liver function by improving blood glutamate calls from mice immunised with FasL expressing COS calls were fused with mouse myeloma cells to produce hybridomas. The hybridomas were screened for anti-FasL activity, and the active

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 107;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENERAL INFORMATION:
APPLICANT: Medical & Biological Laboratories Co., Ltd.
TITLE OF INVENTION: Monoclonal Antibody Specific for
TITLE OF INVENTION: Phosphatidylinositol-3,4,5-Triphosphate
FILE REFERENCE: M3-008-US
CURRENT APPLICATION NUMBER: US/09/257,069
CURRENT FILING DATE: 1999-02-24
PRIOR PILING DATE: 1998-09-07
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB 4; Length 107;
